A Geographic Information System for Regional Planning

R. F. Tomlinson
Department of Forestry and Rural Development,
Government of Canada

As a tool in its program of rural development, Canada is developing a computer-based information system for the storage and manipulation of map-based land data. The system and its capabilities are described.

Canada, like many countries, faces an immense problem in both understanding and guiding the development of its land, water, and human resources. One of the major agencies created specifically to implement policy to attack this problem is the Rural Development Branch of the Department of Forestry and Rural Development. A primary task facing this agency is to assemble social (demographic, economic, and land data for an integrated analysis to enable problems of rural development to be specified, development programs to be implemented, and their effectiveness evaluated.

Parallel with the gathering of data has been the development, by the Regional Planning Information Systems Division of the Branch, of integrated computer-based information systems to handle and analyse the data. The Geographic Information System, for the storage and manipulation of land data is the most developed of these systems. Its design and development started in 1963, implementation began in 1965, and is now in its final stages; routine use is scheduled for September 1968. It is perhaps worthwhile to recount our progress with this system at this time.

Early in the life of the Branch (1962) a start was made with the gathering of some kinds of land data by the Canada Land Inventory. The data they collect is restricted to five types: the present use of the land, the capability of the land for agriculture, the capability of the land for forestry, the capability for recreation, and the capability for supporting wildlife. These data alone, if gathered in sufficient quantities for the summaries to be directly applicable to provincial and federal resource policy and regional planning, will generate an estimated 30,000 map sheets, at various scales. The Inventory has currently produced 7000 map sheets, of which 3000 have been prepared for computer input. The maps contain an average of 800 distinct areas on each sheet, and have been found to contain as many as 4000. Additionally, other types of maps covering watersheds, climate, geology, administrative boundaries, and land titles are generated by other agencies.

The need for a computer-based system, whereby map and related data can be stored in a form suitable for rapid measurement and comparison, is apparent as soon as the magnitude of the problem of handling large numbers of maps is appreciated. Lack of trained personnel makes it impossible to examine such large amounts of data manually in any sensible time, much less to provide a meaningful analysis of the content. A situation can be reached where the amount of data precludes its use. The end product of countless hours of survey can remain unused, with the result that administrators do not receive information necessary for a sound basis to decision making.

GEOGRAPHIC INFORMATION SYSTEMS, SPATIAL DATA
ANALYSIS, AND DECISION MAKING IN GOVERNMENT

第一个地理信息系统的硬件设备

The hardware of the first geographic information system

CGIS所采用的计算机是当时最为流行的**IBM 360系列计算机**。

当时的计算机和我们现在所理解的计算机有很大的不同，它不是一个独立的设备，而是由主机、存储、输入和输出等若干个设备组合而成的。

第一个地理信息系统的硬件设备

The hardware of the first geographic information system

CGIS的存储设备

1. 磁盘机

和今天的硬盘 (hard disk) 类似，只不过比今天的硬盘大得多，存储容量却小得多，整个磁盘组的容量才7.25MB。

» CGIS中所用的数字化仪

由Dobbie McInnes (多比·麦金尼斯) 公司生产的“D-Mac”的制图数字化仪 (X-Y Digitizer)，数字化仪可以将纸质地图上的点数字化成坐标存储到计算机里。

英国设计杂志关于D-Mac数字化仪的报道

Geared for export: three case histories

James Dreaper explores the way three British companies went about designing products which have become outstanding exports. They illustrate the three main categories of export design thinking: products which sell well abroad because they are superbly well designed; products which have been designed for specific overseas markets; and products which have had the needs of foreign markets built into their basic concept.

1 D-mac's Cartographic Digitiser

The three units that make up the Cartographic Digitiser Type CF are a control pedestal, a reading table and an electronics console; together, they fit into an area 10 feet by 6. The system provides a rapid method of converting data contained in maps, photographs or films into a form suitable for computer processing. The "pencil" develops an electrical field which is tracked by a sensing mechanism.
